

Name _____

Derive the Equation of a Parabola (Vertex at Origin)

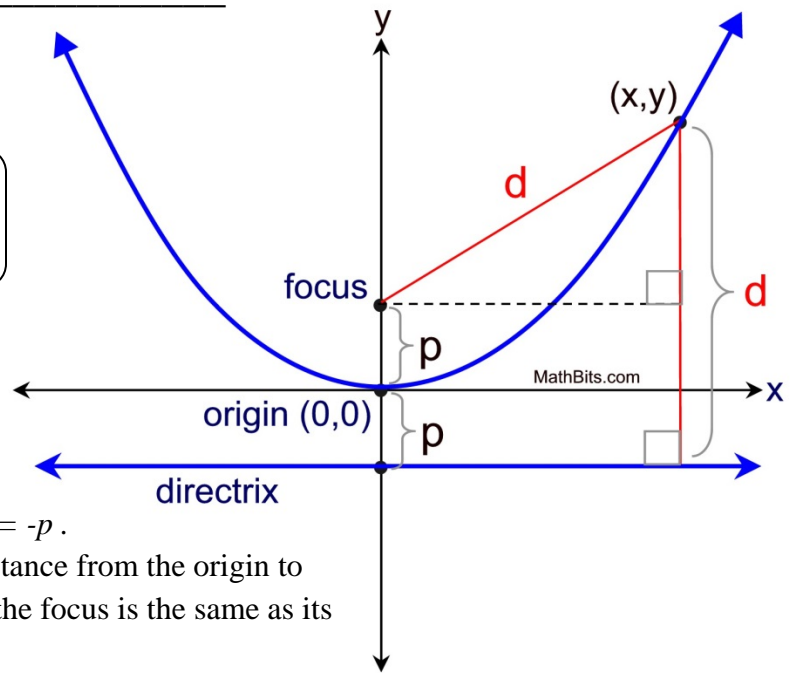

Definition: A parabola is the set of points equidistant from a fixed line (the directrix) and a fixed point (the focus) not on the line.

Given: a parabola with vertex at $(0,0)$ and a focal length of p

Show: the equation of the parabola is $y = \frac{1}{4p}x^2$.

Known: The focus is $(0, p)$ and the directrix is $y = -p$.

The distance from the origin to the focus = the distance from the origin to the directrix. The distance, d , from point (x,y) to the focus is the same as its perpendicular distance, d , to the directrix.

1. Represent the distance, d , from (x,y) to the focus in terms of x , y and p . (*Hint:* use the triangle).
2. Represent the distance, d , from (x,y) to the directrix in terms of y and p .
3. Set the separate equations for d equal to one another.
4. Square both sides and simplify.
