

# Slope Criteria for Perpendicular Lines

Name \_\_\_\_\_

Directions: Supply reasons.

**Theorem:** If two lines are perpendicular, their slopes are negative reciprocals.  
(The product of the slopes = -1.)

**Given:**  $\ell_1 \perp \ell_2$  (let  $m_1 =$  slope of  $\ell_1$ ;  $m_2 =$  slope of  $\ell_2$ )

**Prove:**  $m_1 = -1/m_2$  ( $m_1 \cdot m_2 = -1$ )

For ease of computation, translate the perpendicular lines so the point of intersection will be the origin. Draw a vertical line  $x = 1$  to form  $\triangle ABC$ .

We will be using the Distance Formula and the Pythagorean Theorem to complete this proof.

Proof:

- $\ell_1 \perp \ell_2$  with vertical line  $x = 1$   
(let  $m_1 =$  slope of  $\ell_1$ ;  $m_2 =$  slope of  $\ell_2$ )
- The vertical line,  $x = 1$ , intersects  $\ell_1$  at  $(1, m_1)$  and  $\ell_2$  at  $(1, m_2)$ .

3.  $\angle ABC$  is a right angle.

4.  $\triangle ABC$  is a right triangle.

5.  $BA = \sqrt{1 + m_1^2}$

$BC = \sqrt{1 + m_2^2}$

$AC = \sqrt{(1-1)^2 + (m_1 - m_2)^2} = m_1 - m_2$

6.  $(\sqrt{1 + m_1^2})^2 + (\sqrt{1 + m_2^2})^2 = (m_1 - m_2)^2$

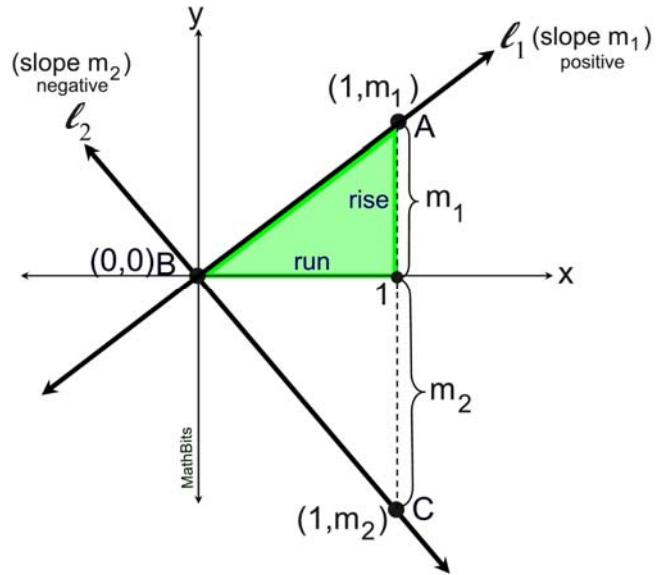

7.  $1 + m_1^2 + 1 + m_2^2 = (m_1 - m_2)^2$

8.  $2 + m_1^2 + m_2^2 = m_1^2 - 2m_1m_2 + m_2^2$

9.  $2 = -2m_1m_2$

10.  $-1 = m_1m_2$

11.  $m_1 = -\frac{1}{m_2}$

**Theorem:** If the slopes of two lines are negative reciprocals, the lines are perpendicular.  
 (The product of the slopes = -1.) (Let  $m_1$  = slope of  $\ell_1$ ;  $m_2$  = slope of  $\ell_2$ )

**Given:**  $m_1 = -1/m_2$  ( $m_1 \cdot m_2 = -1$ )

**Prove:**  $\ell_1 \perp \ell_2$

For ease of computation, translate the lines so the point of intersection will be the origin. Draw a vertical line  $x = 1$  to form  $\triangle ABC$ .

We will be using the Distance Formula to express the sides of  $\triangle ABC$ , and then we will attempt to show that the sides satisfy the Pythagorean Theorem proving  $\triangle ABC$  to be a right triangle (making the lines perpendicular).

*Proof:*

1.  $m_1 = -1/m_2$  ; ( $m_1 \cdot m_2 = -1$ );  
 vertical line  $x = 1$

2. The vertical line,  $x = 1$ , intersects  
 $\ell_1$  at  $(1, m_1)$  and  $\ell_2$  at  $(1, m_2)$ .

3.  $BA = \sqrt{1 + m_1^2}$

$BC = \sqrt{1 + m_2^2}$

$AC = \sqrt{(1-1)^2 + (m_1 - m_2)^2} = m_1 - m_2$

**Will the sides of  $\triangle ABC$  satisfy the Pythagorean Theorem?**

4.  $(\sqrt{1 + m_1^2})^2 + (\sqrt{1 + m_2^2})^2 \stackrel{?}{=} (m_1 - m_2)^2$

5.  $1 + m_1^2 + 1 + m_2^2 \stackrel{?}{=} (m_1 - m_2)^2$

6.  $2 + m_1^2 + m_2^2 \stackrel{?}{=} m_1^2 - 2m_1m_2 + m_2^2$

7.  $2 \stackrel{?}{=} -2m_1m_2$

8.  $-1 \stackrel{?}{=} m_1m_2$

9.  $m_1 = -\frac{1}{m_2}$

10.  $\triangle ABC$  is a right  $\triangle$ .

11.  $\angle ABC$  is right  $\angle$ .

12.  $\ell_1 \perp \ell_2$
